AUTHOR INDEX..... 811

The Subject Index for Volume 30 will appear in the December 1977 issue as part of a cumulative index for the year 1977.

INFORMATION FOR AUTHORS

ICARUS is devoted to the publication of original contributions in the field of solar system studies. Manuscripts reporting the results of new research—observational, experimental, or theoretical—concerning the astronomy, geology, meteorology, physics, chemistry, biology, and other scientific aspects of the solar or extrasolar systems are welcome. The journal generally does not publish papers devoted *exclusively* to the Sun, the Earth, celestial mechanics, or astrophysics. The preferred language of publication is English, but in special cases manuscripts are considered in French, German, or Russian. All papers are reviewed, generally by two independent referees. Authors may be asked to respond to criticisms and suggestions by the referees prior to publication.

Manuscripts are accepted for review with the understanding that the same work has not been and will not be published nor is presently submitted elsewhere, and that all persons listed as authors have given their approval for the submission of the paper; further, that any person cited as a source of personal communications has approved such citation. Written authorization may be required at the Editor's discretion. Articles and any other material published in *Icarus* represent the opinions of the author(s) and should not be construed to reflect the opinions of the Editor(s) and the Publisher.

There are no page charges.

Manuscripts. Authors should submit **four copies** of the manuscript, including figures, tables, etc., to the Editor, and should retain the original typescript. One of the four sets of figures should be suitable for camera-ready reproduction. All manuscripts must be typewritten with wide margins and **double-spaced throughout,** including references and footnotes. Number each page of the manuscript. Include on the first page the title, name(s) and affiliation(s) of author(s) including mailing address(es). At the bottom of this page note the number of manuscript pages, figures, and tables. On the second page indicate a proposed running head of not more than 35 characters, and the name and address to which editorial correspondence and proofs should be directed. The third page should contain a brief abstract, and the text should begin on the following page. Following the main text, give Appendices, Acknowledgments, References, Tables, Figure Captions, and Figures, in that order. Places where Figures and Tables are to appear in the published paper should be marked in the margins of the manuscript.

Tables are to be numbered consecutively with Roman numerals in order of their citation in the text. Each table should be typed, **double-spaced,** on a separate sheet with due regard to the proportions of the printed page. All tables should bear appropriate headings.

Figures. At the time of submission of the manuscript, one original of each figure is to be submitted in such form as to permit photographic reproduction without redrawing: Line drawings should be carefully drafted, no larger than 22 × 30 cm. Both original drawings or standard glossy photographic reproductions are acceptable. The lettering should be large enough to allow a reduction to ½ the original size. **Each figure should be identified with the author's name and figure number.** All figures, whether line drawings or half-tones, should be numbered consecutively in Arabic numerals, in order of their citation in the text. Figure captions should be typewritten on a separate sheet, following the text. Color plates and foldouts are published at the author's expense.

Literature citations in the text should be in one of the following forms: Leighton and Murray, 1966 (for two authors); Marov *et al.*, 1973 (for three or more authors); Robertson, 1937, p. 436 (for reference to a specific page). To distinguish two or more works by the same author(s) in the same year, use suffixes a, b, etc., following the year (e.g., Öpik, 1966a, 1966b).

Literature citations in the bibliography should be **listed alphabetically** according to the surname of the (first) author. Journal references should contain the **names and initials of all authors, the year, the title of the article, the standard abbreviation of the journal, the volume number, and the first and last page numbers.** Titles of journals and books should be in italics, volume numbers in bold face. (In a typed manuscript, indicate italics by single underlining and bold face by sawtooth or double underlining.) Below are shown examples of the proper reference forms for a journal article, a book chapter, and a book, respectively.

Goldreich, P., and Peale, S. J. (1968). The dynamics of planetary rotations. *Ann. Rev. Astron. Astrophys.* **6**, 287–320.

Harris, D. L. (1961). Photometry and colorimetry of planets and satellites. In *Planets and Satellites* (G. P. Kuiper and B. M. Middlehurst, Eds.), pp. 272–342. University of Chicago Press, Chicago.

Krinov, E. L. (1960). *Principles of Meteoritics.* Pergamon Press, New York.

Careful compliance with these instructions for the preparation of the list of references is required; manuscripts with incomplete references (or missing abstracts) may be returned to the author for correction before being considered for publication.

Please write with attention to organization, style, and especially brevity. Present results logically, with order dictated by the needs of the reader. Take special care in composing the title and abstract, since these will be the most frequently read sections of the paper. In the title, specific words are preferable to general ones. The abstract should summarize the conclusions of the research, including quantitative results where appropriate, rather than merely stating the problem.

Whenever possible, quotients in mathematical expressions should employ the solidus (/) rather than be displayed in built-up form. However, for units, exponential notation is preferred (e.g., erg cm^{-2} s^{-1}, not erg/cm^2s). Most authors will recall the difference between "i.e.," and "e.g.", will note that such nouns as "data" are plural and "mare" singular, and will take care to insert a zero before decimal fractions lying between +1 and −1.

Galley proofs will be furnished to authors. When submitting a manuscript, the author should include a list of the symbols employed, identified typographically, not mathematically. This list will not be printed, but will help to avoid costly author's corrections in proof. Fifty *reprints* of each paper will be furnished gratis to the author and additional reprints may be purchased.

International Geophysics Series Edited by J. Van Mieghem and Anton L. Hales
Volume 20

The Earth's Core

J. A. Jacobs
Department of Geodesy and Geophysics, University of Cambridge, England

1976, 262 pp., $22.00/£8.50

Much has been written about the crust and upper mantle of the earth, but little about its deep interior. Yet the role of the earth's core is essential to our understanding of many geophysical phenomena – it is the seat of the earth's magnetic field, and coupling between the core and mantle is responsible for some of the variations in the length of the day. This book is a comprehensive account of our knowledge of the core.

As the innermost regions of the earth are inaccessible to man, no direct measurements of their physical properties can be made. This has led to the "inverse problem" on geophysics, that of determining some physical parameter from a set of observations at the surface of the earth. Seismology and geomagnetism are the most important sources of information and a discussion of these disciplines forms a large part of this book.

The author reviews the evidence for the earth's internal structure, then discusses the present division of the earth into crust, mantle and core. He examines the role of the core in the earth's thermal history, magnetic field and rotation. After a chapter on the construction of the earth's core, he proceeds finally to the question of cores in the moon and terrestrial planets. The advent of satellites and spacecraft has given an added interest to the internal properties of these bodies – measurement of their magnetic field has already given us some clues as to their constitution and possible cores.

This reference work is directed to graduates and research workers in those disciplines from which Professor Jacobs has drawn his material: geophysicists, geologists and astronomers will be grateful to find a single-volume study of this diverse subject.

Mathematical Cosmology and Extragalactic Astronomy

By **IRVING EZRA SEGAL**

Department of Mathematics
Massachusetts Institute of Technology
Cambridge, Massachusetts

A Volume in the PURE AND APPLIED MATHEMATICS Series

1975, 220 pp., $22.50/£11.70

CONTENTS:

GENERAL INTRODUCTION

Standpoint and Purpose. Causality and Geometry—Historical. Conformality, Groups, and Particles—Historical. Natural Philosophy of Chronogeometric Cosmology. The Universal Cosmos—Sketch. The Chronometric Redshift Theory. Theoretical Ramifications; the Cosmic Background Radiation.

MATHEMATICAL DEVELOPMENT

Causal Orientations. Causality in Groups. Causal Morphisms of Groups. Causality and Conformality. Relation to Minkowski Space. Observers and Clocks. Local Observers.

PHYSICAL THEORY

The Cosmos. Postulational Development. Physical Observers. Conformal Geometry and the Unitary Formalism. Causal Symmetries and the Energy. The Redshift. Local Lorentz Frames. Cosmic Background Radiation. Special Relativity as a Limiting Case of Unispatial Theory.

ASTRONOMICAL APPLICATIONS

Introduction. The Redshift-Magnitude Relation. Further Cosmological Tests. The Aperture Correction for Galaxies. Statistical Effect of the Selection of the Brightest Objects. The Peterson Galaxies. Markarian Galaxies and N-Galaxies. The Redshift-Magnitude Relation for Nearby Galaxies. The Redshift-Magnitude Relation for Sandage's Brightest Cluster Galaxies. Preliminary Discussion of Quasars. The N–z Relation for Quasars. The Apparent Magnitude Distribution for Quasars. The Redshift-Luminosity Relation for Quasars. The Redshift-Number Relation for Quasar Subsamples. The Schmidt V/V_m, Test for Quasars in the Chronometric Theory. The Angular Diameter Redshift Relation for Double Radio Sources. Observation Versus Theory for Radio Sources. The Setti-Woltjer Quasar Classes. Other Observational Considerations.

DISCUSSION

General Conclusions. Theoretical Aspects. Further Observational Work.

N.B.: Postage plus 50c handling charge on all orders not accompanied by payment.
